Dittrich, Andreas Geppert, 2000-10-25 Component Database Systems is a collection of invited chapters by the researchers making the most influential contributions in the database industry s trend toward componentization This book represents the sometimes divergent sometimes convergent approaches taken by leading database vendors as they seek to establish commercially viable componentization strategies Together these contributions form the first book devoted entirely to the technical and architectural design of component based database systems In addition to detailing the current state of their research the authors also take up many of the issues affecting the likely future directions of component databases If you have a stake in the evolution of any of today s leading database systems this book will make fascinating reading It will also help prepare you for the technology that is likely to become widely available over the next several years Is comprised of contributions from the field s most highly respected researchers including key figures at IBM Oracle Informix Microsoft and POET Represents the entire spectrum of approaches taken by leading software companies working on DBMS componentization strategies Covers component focused architectures methods for hooking components into an overall system and support for component development Examines the component technologies that are most valuable to Web based and multimedia databases Presents a thorough classification and overview of component database systems

Advances in Object-Oriented Database Systems Asuman Dogac, M. Tamer Özsu, Alexandros Biliris, Timos Sellis, 2013-11-09 Object oriented database management systems OODBMSs have generated significant excitement in the database community in the last decade This interest stems from a real need for data management support for what are called advanced application areas that are not well served by relational technology The case for object oriented technology has been made on three fronts First is the data modeling requirements of the new applications Some of the more important shortcomings of the relational systems in meeting the requirements of these applications include 1 Relational systems deal with a single object type a relation A relation is used to model different real world objects but the semantics of this association is not part of the database Furthermore the attributes of a relation may come only from simple and fixed data type domains numeric character and sometimes date types Advanced applications require explicit storage and manipulation of more abstract types e g images design documents and the ability for the users to define their own application specific types Therefore a rich type system supporting user defined abstract types is required 2 The relational model structures data in a relatively simple and flat manner Non traditional applications require more complex object structures with nested objects e g a vehicle object containing an engine object

Advanced Database Systems Nabil R. Adam, Bharat K. Bhargava, 1993-12-08 Database management is attracting wide interest in both academic and industrial contexts. New application areas such as CAD/CAM, geographic information systems, and multimedia are emerging. The needs of these application areas are far more complex than those of conventional business applications. The purpose of this book is to bring together a set of current research issues that addresses a broad spectrum of topics related to database systems and applications. The book is divided into four parts: object-oriented databases, temporal/historical database systems, query processing in database systems, heterogeneity/interoperability, open system architectures, and multimedia database systems.

Advanced Database Systems Carlo Zaniolo, 1997-05 The database field has experienced a rapid and incessant growth since the development of relational databases. The progress in database systems and applications has produced a diverse landscape of specialized technology areas that have often become the exclusive domain of research specialists. Examples include active databases, temporal databases, object-oriented databases, deductive databases, imprecise reasoning and queries, and multimedia information systems. This book provides a systematic introduction to and an in-depth treatment of these advanced database areas. It supplies practitioners and researchers with authoritative coverage of recent technological advances that are shaping the future of commercial database systems and intelligent information systems. *Advanced Database Systems* was written by a team of six leading specialists who have made significant contributions to the development of the technology areas covered in the book. Benefiting from the authors' long experience teaching graduate and professional courses, this book is designed to provide a gradual introduction to advanced research topics and includes many examples and exercises to support its use for individual study, desk reference, and graduate classroom teaching.

Database and Expert Systems Applications Dimitris Karagiannis, 2013-11-11 The Database and Expert Systems Applications (DEXA) conferences are dedicated to providing an international forum for the presentation of applications in the database and expert systems field for the exchange of ideas and experiences and for defining requirements for the future systems in these fields. After the very promising DEXA 90 in Vienna, Austria, we hope to have successfully established with this year's DEXA 91 a stage where scientists from diverse fields interested in application-oriented research can present and discuss their work. This year there was a total of more than 250 submitted papers from 28 different countries in all continents. Only 98 of the papers could be accepted. The collection of papers in these proceedings offers a cross-section of the issues facing the area of databases and expert systems, i.e., topics of basic research interest on one hand and questions occurring when developing applications on the other. Major credit for the success of the conference goes to all of our colleagues who submitted papers for consideration and to those who have organized and chaired the panel sessions. Many persons contributed numerous hours to organize this conference. The names of most of them will appear on the following pages. In particular, we wish to thank the Organization Committee Chairmen Johann Gordesch, A. Min Tjoa, and Roland Wagner, who also helped establishing the program. Special thanks also go to Gabriella Wagner and Anke Ruckert. Dimitris Karagiannis, General Conference Chairman. Contents. Conference Committee.

Aspect-Oriented Database Systems Awais Rashid,2013-03-14 Recently a set of new software development techniques termed Aspect Oriented Software Development AOSD has become available that aims to support modularisation of systemic properties also referred to as crosscutting concerns and their subsequent composition with other parts of the system Rashid focuses on the use of Aspect Oriented Programming AOP techniques to modularise otherwise broadly scoped features in database systems like the transaction or the versioning model to improve their customisability extensibility and maintainability His aim is to show how the use of AOP can transform the way we develop use and maintain database systems He also discusses how database systems can support AOP by providing means for storage and retrieval of aspects Aspect Oriented Databases Systems shows the possible synergy between AOSD and database systems and is of particular interest for researchers graduate students and software developers in database systems and applications

Issues in Developing Object-Oriented Database Systems for Real-Time Applications ,1994 Database systems for real time applications must satisfy timing constraints associated with transactions in addition to maintaining data consistency Recently interests in object oriented databases have been growing for nontraditional applications of database systems and several real time applications are being developed using an object oriented paradigm The object oriented approach seems promising for developing complex real time database applications However it is not clear whether object oriented database systems would be superior than relational database systems for supporting real time applications In this paper we address issues that must be investigated in order to design and develop an object oriented database system for realtime applications Also we present a model that integrates features for scheduling real time transactions with the traditional object oriented database model
