Age Estimation of Living South African Individuals Andre Uys, 2019 Age estimation in living individuals around the legal age of 18 years remains a difficult challenge with limited options available In this study third molar development was used along with the novel method of anterior inferior vertebral ring apophysis development to assess the age of living individuals and the probability of being 18 years For third molar development panoramic radiographs of 705 white and 563 black South Africans were scored using a 10 stage scoring system Vertebral apophysis development of C2 C3 and C4 of 496 white and 478 black South Africans were assessed from cephalometric radiographs using a four stage scoring system Likelihood values were determined for individuals in each sex and population group being 18 years based on developmental stages For apophysis development the median ages for attainment of stages 0 1 and 2 were below the 18 year threshold for all ancestry and sex groups while stage 3 was also below this threshold in some groups For third molar development black South African individuals consistently matured earlier than white South African individuals while for most of the stages the opposite was true for apophysis development Differences between the sexes were also noted for third molar but not for vertebral apophysis development These age indicators were also combined by using a generalised linear model GLM The combined sample comprised of 165 females and 122 males aged between 15 and 18 years Four additional models were obtained from data sets only containing data for third molar and cervical ring apophysis development respectively The performance of all the models were quantified and compared using the Akaike information criterion AIC as an estimator of the relative quality of the statistical models and the prediction error as a mean square error value The best performance resulted from third molar development although the vertebral data adds a component related to skeletal development which may better reflect biological reality These results show that cervical vertebral apophysis development is a valuable novel addition to the assessment of age in living individuals Both these methods are easy to use and can be assessed from standard and routinely used radiographic images The developed models need to be sex and ancestry specific as clear differences were noted

A Comparison of Four Methods of Dental Age Estimation and Age Estimation from the Risser Sign of the Iliac Crest Rebekah A. Goltz, 2016 Age estimation techniques are of medicolegal importance for estimating the age of living asylum seekers as well as for unidentified human remains from forensic cases As there are many techniques for age estimation this study compares four different methods using dental radiographs of modern subadults under 18 years to determine which is more accurate for the modern sample Additionally this study explores age estimation from apophyseal fusion in the pelvis using the Risser method of the iliac crest compared to estimates of dental age This study additionally compares the accuracy of four dental age estimation methods including Schour and Massler 1941 Schour and Massler 1944 Ubelaker 1989 and the London Atlas Method by AlQahtani et al 2010 To determine the accuracy of the methods this project correlates the actual age of modern individuals and the age estimated by each of the aforementioned methods Overall it was found that Schour and Massler 1941 Schour and Massler 1944 and the London Atlas Method overestimated the age while the Ubelaker method slightly underestimated the age All dental age estimation methods far exceed the accuracy of apophyseal fusion of the iliac crest using the Risser method

Forensic Anthropology and Medicine Aurore Schmitt, 2007-11-09 Recent political religious ethnic and racial conflicts as well as mass disasters have significantly helped to bring to light the almost unknown discipline of forensic anthropology This science has become particularly useful to forensic pathologists because it aids in solving various puzzles such as identifying victims and documenting crimes On topics such as mass disasters and crimes against humanity teamwork between forensic pathologists and forensic anthropologists has significantly increased over the few last years This relationship has also improved the study of routine cases in local medicolegal institutes When human remains are badly decomposed partially skeletonized and or burned it is particularly useful for the forensic pathologist to be assisted by a forensic anthropologist It is not a one way situation when the forensic anthropologist deals with skeletonized bodies that have some kind of soft tissue the advice of a forensic pathologist would be welcome Forensic anthropology is a subspecialty field of physical anthropology Most of the background on skeletal biology was gathered on the basis of skeletal remains from past populations Physical anthropologists then developed an indisputable know how nevertheless one must keep in mind that looking for a missing person or checking an assumed identity is quite a different matter Pieces of information needed by forensic anthropologists require a higher level of reliability and accuracy than those granted in a general archaeological context To achieve a positive identification findings have to match with evidence particularly when genetic identification is not possible

Age Estimation Using the Hand-wrist Ariane Kandace Maggio, 2014 Truncated abstract With increasing global migration the importance of estimating age for living individuals has increased due to the need to assess legal culpability and or legal and social characterisation in the absence of documentation Age estimates in living sub adult individuals rely on the analysis of radiographs or CT scans of skeletal morphology in order to evaluate the skeletal development based on morphoscopic or morphometric analyses In Australia various age estimation techniques have been utilised in order to evaluate the age of individuals who do not have documentation to determine legal minority culpability The latter estimation techniques are not population specific and are thus known to be less accurate than population specific standards for the estimation of age The study aimed to produce sex specific age estimation standards for a contemporary Western Australian population from the morphoscopic evaluation of the skeletal development of the hand and wrist The study sample comprised 360 individuals 180 male 180 female between birth and 25 years of age Age assessment was performed following the established Greulich Pyle and Tanner Whitehouse morphoscopic methods

Age Markers in the Human Skeleton M. Yaşar Işcan, 1989

Dental Anthropology Kurt W. Alt, Friedrich W. Rösing, Maria Teschler-Nicola, 2012-12-06 Shelley Saunders This book offers a welcome diversity of topics covering the broader subjects of teeth and the study of teeth by anthropologists There is an impressive array of coverage here including the history of anthropological study of the teeth morphology and structure pathology and epidemiology the relationship between nutrition human behavior and the dentition age and sex estimation from teeth and geographic and genetic variation Most chapter authors have provided thorough reviews of their subjects along with examples of recent analytical work and recommendations for future research North American researchers should particularly appreciate the access to an extensive European literature cited in the individual chapter bibliographies Physical anthropologists with even a passing interest in dental research should greet the publication of this book with pleasure since it adds to a growing list of books on how the study of teeth can tell us so much about past human populations In addition to the archaeological applications there is the forensic objective of dental anthropology which the editors refer to in their introduction which is dealt with in this volume The chapters dealing with methods of sex determination age estimation of juveniles and age estimation of adults using the teeth are exhaustive and exacting and of critical importance to both osteoarchaeologists and forensic anthropologists Authors Liversidge Herdeg and Rosing provide very clear guidelines for the use of dental formation standards in juvenile age estimation recommendations that are so obviously necessary at this time

Estimation of Age by Modified Gustafson's Method Bajpai Manas, Girish K. L., Farzan Rahman, 2014 In this universe most of the things natural or artificial can be dated numbered quantified or measured The concept of the age and time had come into the mind of the human being for centuries possibly millennia One can also measure life span of a person as well as ones age from the moment of conception Age estimation can prove critical part in victim identification process In cases of unknown dead bodies age estimation becomes necessary if there is no ante mortem information available and a personal profile has to be reconstructed In addition age estimation can be done in precious archaeological skeletal material dating back to hundreds of years The branch of Forensic Medicine which deals with the examination of teeth is known as Forensic Odontology This book described the most accurate significant relatively easy and reproducible method of age estimation by tooth
