

Natural Selection Quiz Review Guide

- Write the definition of evolution. Give an example.
Evolution is the change in a population over a gradual period of time. Examples: the peppered moths changed colors as their environment changed color.
- Why does evolution occur? Explain using: natural selection, variation, and random mutations.
Random mutations occur in populations all of the time. Mutations that produce variations (ie white fur instead of brown) sometimes help an organism ADAPT to its environment BETTER. Organisms that are better adapted are more likely to live and produce offspring. Eventually, this trait can take over a population.
- How does studying embryos give us clues to which organisms are most closely related? Give an example.
Embryos that have the most similarities throughout gestation are most likely more closely related. For example, the rabbit and the human are almost identical up until the third trimester.
- What is the difference between artificial and natural selection. Give examples of each.
Artificial is driven by humans while natural selection is driven by nature. Dogs are an example of artificial selection while wolves are an example of natural selection.
- Describe the bunny lab. What made the bunny population grow? Disappear? Change?
In the bunny lab, you could add mutations that enabled the bunnies to better adapt to their environments (ie food sources, habitat, predators). A favorable trait quickly replaced the less favorable one.
- Below is a phylogeny (tree of common ancestors):
 - How are common ancestors indicated? Intersecting lines.
 - Which organisms are most closely related? Bear/Chimp
 - Which organisms are least related? Lamprey/Sunfish
 - Which organism is most closely related to a Lamprey? Sunfish
- What is the definition of a species?
A population of animals that can interbreed and produce fertile offspring.
- Are ligers, zorses, and mules considered their species? Why or why not?
No. They can mate but their offspring are sterile. You cannot breed two ligers and make more ligers.
- Define "niche" and "competition". Give examples of each.
A "niche" is the role or function of an organism in its environment. "Competition" is a negative interaction between organisms where they are competing for the same limited resource (ie food or shelter). Examples: a predator's "niche" is often to control prey populations. "Competition" occurs between tigers who occupy and hunt in overlapping territories.
- What is a vestigial trait? Give an example.
A trait that is no longer needed/used but was inherited from a common ancestor. Examples: wisdom teeth, appendix, facial hair, ear muscles, etc.
- What is the difference between analogous and homologous traits? Check all that are true.

	Analogous	Homologous
Related Species? (ie bear and chimp)		<u>X</u>
Unrelated? (ie sunfish and chimp)	<u>X</u>	
Same structure?		<u>X</u>
Same function?	<u>X</u>	<u>(sometimes)</u>
Example:	<u>Bird and butterfly wing</u>	<u>Hand bones in whales and humans</u>

Natural Selection J. Phil Gibson, Terri R. Gibson, 2009 In his groundbreaking book Natural Selection Charles Darwin explained his theory that evolution is driven by adaptation of species to their environmental surroundings From the tiniest microbe to the largest whale all organisms have changed over vast expanses of time due to the forces of natural selection This new title in the Science Foundations series provides an overview of the processes and causes that drive natural selection and the principles that explain how it operates using numerous diverse organisms as examples Natural Selection promotes a solid understanding of how organisms change over the course of generations and how current biodiversity came to be

Arrival of the Fittest Andreas Wagner, 2014-10-02 Natural selection can preserve innovations but it cannot create them Nature's many innovations some uncannily perfect call for natural principles that accelerate life's ability to innovate Darwin's theory of natural selection explains how useful adaptations are preserved over time But the biggest mystery about evolution eluded him As genetics pioneer Hugo de Vries put it natural selection may explain the survival of the fittest but it cannot explain the arrival of the fittest Can random mutations over a mere 3.8 billion years really be responsible for wings eyeballs knees camouflage lactose digestion photosynthesis and the rest of nature's creative marvels And if the answer is no what is the mechanism that explains evolution's speed and efficiency In *Arrival of the Fittest* renowned evolutionary biologist Andreas Wagner draws on over fifteen years of research to present the missing piece in Darwin's theory Using experimental and computational technologies that were heretofore unimagined he has found that adaptations are not just driven by chance but by a set of laws that allow nature to discover new molecules and mechanisms in a fraction of the time that random variation would take Consider the Arctic cod a fish that lives and thrives within six degrees of the North Pole in waters that regularly fall below 0 degrees At that temperature the internal fluids of most organisms turn into ice crystals And yet the arctic cod survives by producing proteins that lower the freezing temperature of its body fluids much like antifreeze does for a car's engine coolant The invention of those proteins is an archetypal example of nature's enormous powers of creativity Meticulously researched carefully argued evocatively written and full of fascinating examples from the animal kingdom *Arrival of the Fittest* offers up the final puzzle piece in the mystery of life's rich diversity

Evolutionary Game Theory, Natural Selection, and Darwinian Dynamics Thomas L. Vincent, Joel S. Brown, 2005-05-23 All of life is a game and evolution by natural selection is no exception The evolutionary game theory developed in this 2005 book provides the tools necessary for understanding many of nature's mysteries including co evolution speciation extinction and the major biological questions regarding fit of form and function diversity procession and the distribution and abundance of life Mathematics for the evolutionary game are developed based on Darwin's postulates leading to the concept of a fitness generating function G function G function is a tool that simplifies notation and plays an important role developing Darwinian dynamics that drive natural selection Natural selection may result in special outcomes such as the evolutionarily stable strategy ESS An ESS maximum principle is formulated and its graphical representation as an adaptive landscape illuminates concepts such as adaptation Fisher's Fundamental Theorem of Natural Selection and the nature of life's evolutionary game

Natural Selection Mario A. Fares, 2014-11-21 This book summarizes the knowledge in the field of methods to identify signatures of natural selection A number of mathematical models and methods have been designed to identify the fingerprints of natural selection on genes and genomes Such methods are provided in a simple and direct way so that students of different disciplines can navigate thr
