Notation: $\mathbf{T} := [-\pi, \pi]$.

Exercises

- Let γ : [a, b] → ℝ² be a parametrization for the closed curve Γ.
 - (a) Prove that γ is a parametrization by arc-length if and only if the length of the curve from $\gamma(a)$ to $\gamma(s)$ is precisely s a for each $s \in [a, b]$, that is,

$$\int_{a}^{s} |\gamma'(t)| dt = s - a.$$

(b) Prove that any curve Γ admits a parametrization by arc-length. [Hint: If η is any parametrization, let $h(s) = \int_a^s |\eta'(t)| dt$ and consider $\gamma = \eta \circ h^{-1}$.]

Proof. (a) (\Rightarrow) is trivial. (\ll) This is the definition of arc-length.

- (b) is proved as hint and (a).
- Suppose γ : [a, b] → ℝ² is a parametrization for a closed curve Γ, with γ(t) = (x(t), y(t)).
 - (a) Use integration by parts, one can show that

$$\frac{1}{2}\int_{a}^{b} (x(s)y'(s) - y(s)x'(s)) \, ds = \int_{a}^{b} x(s)y'(s) \, ds = -\int_{a}^{b} y(s)x'(s) \, ds.$$

(b) Define the reverse parametrization of γ by γ^- : $[a, b] \to \mathbb{R}^2$ with $\gamma^-(t) = \gamma(b + a - t)$. The image of γ^- is precisely Γ , except that the points $\gamma^-(t)$ and $\gamma(t)$ travel in opposite directions. Thus γ^- "reverses" the orientation of the curve. It's easy to prove that

$$\int_{\gamma} (xdy - ydx) = -\int_{\gamma^-} (xdy - ydx).$$

Fourier Analysis Elias M. Stein,Rami Shakarchi,2011-02-11 This first volume a three part introduction to the subject is intended for students with a beginning knowledge of mathematical analysis who are motivated to discover the ideas that shape Fourier analysis It begins with the simple conviction that Fourier arrived at in the early nineteenth century when studying problems in the physical sciences that an arbitrary function can be written as an infinite sum of the most basic trigonometric functions. The first part implements this idea in terms of notions of convergence and summability of Fourier series while highlighting applications such as the isoperimetric inequality and equidistribution. The second part deals with the Fourier transform and its applications to classical partial differential equations and the Radon transform a clear introduction to the subject serves to avoid technical difficulties. The book closes with Fourier theory for finite abelian groups which is applied to prime numbers in arithmetic progression. In organizing their exposition the authors have carefully balanced an emphasis on key conceptual insights against the need to provide the technical underpinnings of rigorous analysis Students of mathematics physics engineering and other sciences will find the theory and applications covered in this volume to be of real interest. The Princeton Lectures in Analysis represents a sustained effort to introduce the core areas of mathematical analysis while also illustrating the first highlight the far reaching consequences of certain ideas in analysis to other fields of mathematics and a variety of sciences. Stein and Shakarchi move from an introduction addressing Fourier series and integrals to in depth considerations of complex analysis measure and integration theory and Hilbert spaces and finally further topics such as functional analysis distributions and elements of probability theory
